

1A: <Harsith902>

My Enigma number

E =

github username = harsith902

position	character	value	multiplier	
1	h	8	1	8
2	a	1	2	2
3	r	18	4	72
4	s	19	8	152
5	i	9	16	144
6	+	20	32	640
7	h	8	64	512
8	9	9	128	1152
9	0	0	256	0
10	2	2	512	1024
				<u>3706</u>

E = 3706

* level - 1A The Bridges of city.

Initial map

$3 \Rightarrow P-C \Rightarrow$ odd no.s
 $7 \Rightarrow Q-C$ so 2 bridges
 $0 \Rightarrow R-C$ form next
 $6 \Rightarrow S-C$ to them.

Final Bridge

2. Draw Bridges

Total = 4 + 2 + 2 + 1 + 1
 Bridges (outer island) [double Bridges] single bridge to center

R. My guess is walk is possible.

3. Attempt 1: X X

① $S \rightarrow P \rightarrow \boxed{C \rightarrow R} \rightarrow S$

$\boxed{R \leftarrow C} \leftarrow Q \leftarrow P \leftarrow C$

↓
Q.

⇒ This path is not possible.

as $C \rightarrow R$ is used 2 times.

② Attempt 2. ✓✓

Here the double bridges are used for $Q \rightarrow C$ path.
and the walk is possible.

③ Attempt 3. X X.

This path is not possible as $C-R$ is used 2 times.

4. Count

Island	The Bridges
P	4 Bridges
Q	4
R	3
S	3
C	6

Ques 1. casel: Endpt = start pt.

arrival and departure.

↓
so pair

OK, so every island will have arrival and departure, so they will have an even count.

But if count is odd then it suggest that the start and end will be on the same island.
